Abstract

Introduction: Breast Phyllodes Tumors are rare entities, however distant metastases are exceptional. Their management is not codified. The aim of these cases study was to describe this metastatic rare disease and their management.

Cases presentation: Three women aged 30, 68 and 38 were treated in the National Institute of Oncology in Morocco for metastatic breast phyllodes tumors. Two of them died rapidly due to the rapid growth of the disease.

Conclusion: Metastatic tumors have a poor prognosis with no long-term survival, death occurs within 24 months after the appearance of metastases, chemotherapy must be done as rapid as possible
